

PROBLEM STATEMENT:

Print the space-separated name and email address pairs containing valid email addresses only. Each pair must be printed on a new line in the following format:

```
name <user@email.com>
```

You must print each valid email address in the same order as it was received as input.

Sample Input

```
2
DEXTER <dexter@hotmail.com>
VIRUS <virus!@variable.:p>
```

Sample Output

```
DEXTER <dexter@hotmail.com>
```

Explanation

dexter@hotmail.com is a valid email address, so we print the name and email address pair received as input on a new line.

virus!@variable.:p is not a valid email address because the username contains an exclamation point (!) and the extension contains a colon (:). As this email is not valid, we print nothing.

PROGRAM:

```
import re
import email.utils
import sys

def validate_emails():
    input_data = sys.stdin.read().splitlines()
    if not input_data:
        return
    n = int(input_data[0])
    pattern = r'^[a-zA-Z][a-zA-Z0-9._-]*@[a-zA-Z]+\.[a-zA-Z]{1,3}$'

    for i in range(1, n + 1):
        raw_input = input_data[i]
        parsed_name, parsed_email = email.utils.parseaddr(raw_input)
        if re.match(pattern, parsed_email):
            print(email.utils.formataddr((parsed_name, parsed_email)))

if __name__ == "__main__":
    validate_emails()
```

OUTPUT:

Congratulations!

You have passed the sample test cases. Click the submit button to run your code against all the test cases.

✓ Sample Test case 0

Input (stdin)

```
1 2
2 DEXTER <dexter@hotmail.com>
3 VIRUS <virus!@variable.:p>
```
